

**Amendment #2
RFQ NNC13ZRH006Q
C-Band Solid State Power Amplifiers**

This document presents 4 question and 4 answers.

1) *Q – Are these used on the ground or air based portion of the link?*

A – Primarily ground, but they may be used on the aircraft.

2) *Q – What are the power consumption requirements?*

A – There is more than adequate power available in either location, so prime power consumption is not a major consideration.

3) *Q – There is a requirement for a “Front panel RF output power indication.” We need clarification of this requirement. Is this a readout of the actual RF output power, a simple “Power Good” light, or something in between?*

A – The requirement is for the display of actual power output level, either in Watts or dBm – this choice is left to the offeror.

4) *Q – Is this procurement set aside for small business?*

A – No, this procurement is full and open.
